

ATTEMPT TO WRITE A READONLY DATABASE SVN REVERT

Working copies on shares frequently cause problems (including/especially with permissions) - as a result, it is not a recommended.

First I set up an empty repository on at Github and added the server's public key so it has the ability to commit to the repository. For example, we wanted our wikid. The Windows icon cache is a fairly buggy creature. Then select "change author" or "change log message" from the context menu. Maybe not today, maybe not tomorrow, but someday you will. If one person installs a newer version of the client which upgrades the repository format, then everyone else will be unable to access the repository until they also upgrade to the new client version. If you have mapped network drives which are not resolved, either because the drive is inaccessible, or you have not logged in, file browsing may become unresponsive while Windows tries unsuccessfully to access the drive. Select the Appearance tab. How can I The metadata inside the working copies used by the different clients is identical. Please update to the latest version of TortoiseSVN to avoid such problems in the future. Use the full command in the sudoers file rather than just the chmod program without any parameters to reduce security risk to a minimum. All users checkout the repository with the generic svn user, as their RSA key will determine the identity that their commits should be logged as. You must also be sure that all the clients are built for the same OS. A short explanation: The treeview always shows the whole explorer tree, including network drives and other namespace extensions. Note that these developer users are just those that will be accessing the repository from within the server itself, not those that access from remote locations. Just to make this clear: this is not because we're lazy programmers, it really is necessary. Read about the Subversion property svn:keywords in the Subversion book. Choose the one you want to keep and overwrite the conflicting property with that one. Open that file in a text editor and you will see the conflicting properties. Why does TortoiseSVN not recognize that a file has been modified? In our example above Modified. And reboot. Yes, it is. Aehemm: select the folder and hit Delete the key on your keyboard may be labelled only Del. You have to set the access permissions in just the right way. That's a problem with the explorer and outside of TortoiseSVN's reach. Since SSH completely takes care of the authentication process, Subversion won't even see the author who does the commit.
